Homework Assignment 2

Objective: Your task is to explore and locate GIS (Geographic Information Systems) data using any preferred search engine. You are required to identify and download data from five distinct websites. Once downloaded, this data should be successfully imported and viewed using the ArcGIS software.

Instructions:

- Conduct a thorough search to find five unique websites offering GIS data suitable for your study or area of interest.
- Download the GIS data from these websites.
- Open and examine the data in ArcGIS software to ensure compatibility and usability.
- For each dataset, provide a brief overview (50-60 words) detailing the data's characteristics, such as its description, resolution, and any other relevant information.
- Upload the pdf document on Blackboard.

Collaboration and Sharing:

Your findings and insights will be compiled and shared with your classmates upon completion. This collaborative effort aims to amass a comprehensive resource pool, with approximately 40 different data sources collectively gathered by the eight students participating in the class. This shared repository will be valuable for your ongoing and future GIS projects for all class students.
